

Liu Ming

Male | Age: 32 | Phone: 15332335062 | 9 years of experience

Target Role: Frontend Development Engineer | Expected Salary: 20–25K | Preferred City: Xi'an

PERSONAL STRENGTHS

- Full-stack perspective & deep expertise: 8+ years of frontend experience spanning mobile (UniApp, Flutter, HarmonyOS), desktop (Electron and other cross-platform solutions), and web admin systems (React, Vue). Able to quickly own and lead complex frontend deliveries end to end.
- Engineering & architecture mindset: Strong in micro-frontend architecture and performance optimization. Skilled at modularization, build optimization, and standards in large projects to improve team collaboration and maintainability. Experience building frontend infrastructure from scratch.
- AI-native development practitioner: Deeply integrates Cursor, AI OpenCode, and similar tools into daily workflows, boosting code generation, refactoring, debugging, and documentation. Early adopter of human–AI collaboration for solving complex technical problems.
- Data visualization & UX specialist: Proficient with ECharts and related libraries; designs high-performance, highly interactive dashboards tailored to business scenarios, balancing aesthetics and usability.
- Fast learner & cross-platform adaptability: High technical sensitivity; quickly adopts emerging platforms such as HarmonyOS and ships production projects. Balances tech selection with risk control and drives continuous technology evolution for the team.
- Results-driven team leadership: Strong communication and collaboration. Can both resolve hard technical bottlenecks independently and lead teams as a technical lead. Enjoys knowledge sharing and mentoring to raise the team's overall technical level.

Certificate: Systems Architecture Designer

WORK EXPERIENCE

Shaanxi Huanxin Henghui Electronic Technology Co., Ltd. — Frontend Development Manager

Jun 2020 – Present

Overview: As frontend team lead, own architecture design and R&D management for environmental-protection informatization and smart-government products. Lead a 4–6 person frontend team delivering multi-platform business, and drive engineering standards and delivery efficiency.

Key Responsibilities & Achievements:

- Team management & tech infrastructure: Own daily team management, task allocation, and code quality. Establish coding standards, Git workflows, and CI/CD. Built a shared platform base on micro-frontends (qiankun / Module Federation), enabling independent deployment and seamless integration of business subsystems to support rapid expansion of core product lines.
- Cross-platform multi-end R&D: Led the company's mobile strategy shift—hybrid and native-performance apps with UniApp and Flutter covering iOS/Android and HarmonyOS devices; delivered Electron desktop apps, forming a “one backend, multi-end reach” product matrix and improving customer stickiness.
- Data visualization dashboards: For environmental monitoring and pollution-source analysis, built an interactive dashboard component library on ECharts and Canvas—real-time data refresh, map drill-down, and multi-dimensional filtering—now running stably in multiple prefecture-level government and enterprise projects.
- Performance & tooling: Addressed slow SPA first paint and memory leaks via route-based lazy loading, SSR (Next.js/Nuxt), and caching—core page load improved by 40%+. Upgraded Webpack/Vite toolchain, cutting build time by ~60%.
- AI-assisted development: Introduced Cursor and AI OpenCode team-wide; defined AI coding standards and review processes; raised repetitive coding efficiency by 30%+; regularly ran internal tech shares to shift the team toward an “AI + human” collaboration model.
- Cross-team delivery & pre-sales: Closely partnered with product, backend, and QA; joined requirement reviews and technical design; drove tech selection and risk foresight for on-time, high-quality delivery; supported pre-sales with frontend feasibility plans and demos.

Tech leadership: Micro-frontends (qiankun/Module Federation) | Vue/React | UniApp/Flutter/HarmonyOS | ECharts/GIS | Webpack/Vite. Introduced Cursor + AI-assisted development (+30% per-person efficiency); built scaffolding, CI/CD, and coding standards from scratch; supported team growth from 3 to 10 people.

Xi'an Yunqing Software Technology Co., Ltd. — Frontend Developer

Jun 2018 – Jun 2020

- Frontend page development and optimization with HTML, CSS, and JavaScript.

- Responsive layouts with Bootstrap and similar frameworks across screen sizes.
- Interactive UX with jQuery and related libraries.
- Build and performance optimization with Webpack to improve load speed and UX.
- Improved homepage load time, page render performance, mobile responsiveness, and interactions (infinite scroll, pull-to-refresh) to lift retention and satisfaction.

KEY PROJECTS

Shaanxi Corps Water & Air Comprehensive Analysis Platform — Frontend Development Manager

Mar 2026 – Present

Led frontend architecture and core module development for the provincial environmental monitoring core system—covering real-time water monitoring stations, AQI, pollutant trend forecasting, and more—serving province–city–county environmental agencies.

- Adopted qiankun micro-frontends: split water environment, atmospheric environment, and pollution-source modules into independently developed/deployed sub-apps integrated via a host shell, enabling three-level data drill-through and fine-grained permission isolation while reducing parallel-dev conflicts and release coupling.
- Built an ECharts + Canvas dashboard component library for GIS map drill-down of province-wide monitoring points, linked multi-dimensional charts, and real-time data streams.
- Performance: route lazy loading, on-demand components, Nginx Gzip, and polling throttling—dashboard first paint from 4.2s to under 1.5s; 7×24 stable operation for monitoring halls; chart config tooling cut new chart development time by ~60%.

Stack: qiankun | Vue3 + TypeScript | ECharts | Canvas | GIS maps | Vite | Axios polling

Yan'an Eco-Environment Integrated Management Platform — Frontend Development Manager

Mar 2023 – Present

Owned overall frontend architecture for 20+ subsystems: monitoring, visualization dashboards, mobile enforcement App, enterprise App, OA, video conferencing, emergency command, noise supervision, water improvement governance, and more.

- Micro-frontends + route distribution for a unified portal with SSO; subsystems independently developed and deployed.
- UniApp for mobile enforcement; Flutter for the enterprise app; WebRTC for remote dispatch video meetings.
- Reusable component library and scaffolding cut new subsystem delivery from 3 weeks to 1 week; main portal load from 3.8s to 1.2s; overall bundle kept under 2MB.

Stack: Micro-frontends (qiankun) | Vue/React | UniApp | Flutter | WebRTC | ECharts

Other Provincial / Prefecture Environmental Informatization Projects (99+) — Frontend Development Manager

Jun 2020 – Present

Continuously led or contributed to Shaanxi provincial and municipal environmental informatization programs—99+ independent projects and modules covering air governance, monitoring, emergency command, dual-random inspections, digital villages, video remote sensing, noise supervision, and more—forming a complete smart environmental-protection product matrix.

Representative projects: Shaanxi Atmospheric Environment Integrated Management Platform; Shaanxi Vehicle Emission Supervision Platform (sky–ground–vehicle–person integration); Dual-Random Inspection System; Emergency Command & Dispatch Platform; Digital Village Eco-Environment Platform; Video Remote-Sensing Analysis Platform; Noise Online Supervision Platform; Pollution-Source Monitoring Data Management Platform; Shaanxi Key Air Pollution Source Monitoring Platform (Vue3 + TS + Vite rebuild across PC admin, enterprise, and H5; IoT data for non-on-site supervision visualization).

Core contributions:

- Cross-project reusable component and utility libraries (ECharts configs, GIS wrappers, upload/download, CRUD page templates)—reused in 10+ projects, cutting duplicate work by ~30%.
- Unified frontend scaffolding and CI/CD pipeline templates—new project init from 2 days to 1 hour.
- Scaled Cursor + AI-assisted development for boilerplate, API mock data, comments, and unit tests—~30% per-person productivity gain.
- Progressive migration of legacy jQuery/Backbone systems to Vue/React with zero business interruption.

Stack: Vue2/3 | React | TypeScript | ECharts/GIS | Micro-frontends | UniApp | Webpack/Vite | CI/CD (Jenkins/GitLab CI)
